

Rako Launches iPhone App

Rako has released an iPhone™ App, now downloadable from the iTunes™ App Store that allows control of a Rako installation from an iPhone™ or iPod Touch™. Giving control of any room, whether it be lighting or curtain/blind control.

The App gives access to all the available rooms, scenes and channels, all of which can be named for easy identification. The App can be used with existing wireless systems, the new wired network or combined systems.

System requirements

To allow the iPhone to communicate with the network a Rako APR-Bridge (for use with wireless-only systems) or WRE-Bridge (for wired systems) needs to be installed along with a wireless router for the Wi-Fi link with the iPhone™. The Bridge needs to be uploaded with a Rasoft programming file for the project. The file can either be the existing project file, if available, or created using the Rasoft programming software (included) which requires a PC running Windows XP or Vista.
